

Solution Requirements

Date	30 June 2026
Team ID	SWTID-2026-3278
Project Name	Credit card Approval Prediction
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users (Admin/Bank Officer) must log in securely using a username and password.	High
2	Authorization levels	Admin can manage users and the system. Bank officers can view applications and prediction results only.	High
3	External interfaces	The system connects with the credit card application database and machine learning model to retrieve applicant details and predict approval status.	High

4	Transactions processing	The system accepts applicant details, validates the data, processes it using the ML model, and predicts whether the credit card application is Approved or Rejected.	High
5	Reporting	Generate reports showing applicant details, prediction results, approval rates, and application history.	Medium
6	Business rules, etc.	Approval depends on factors such as credit score, annual income, employment status, debt-to-income ratio, loan history, and repayment behavior.	High
7	Compliance to laws or regulations	<i>Ensure customer data privacy, secure data storage, and compliance with banking and data protection regulations.</i>	High

Step 2: Non-Functional Requirements (NFR)

S.NO	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Scalability	Protect applicant data using secure login, encryption, and role-based access.	100% encrypted sensitive data and secure authentication.

2	Security & Data Privacy	<i>The system should provide accurate predictions with minimal downtime.</i>	99% system availability and prediction accuracy above 90%.
3	Reliability & Availability	The system should support a large number of users and applications simultaneously.	Handle 10,000+ applications without performance issues.
4	Usability & Accessibility	The interface should be simple and easy to use for bank staff and administrators.	<i>The interface should be simple and easy to use for bank staff and administrators.</i>
